

Auto Weather

This is a rough idea of what a built-in touch-screen system interface might look like in a car if it had integrated weather features. In addition to the info traditionally displayed constantly (time, compass, temperature, radio frequency), basic weather data, such as the day's HI/LO numbers could be displayed on the main screen. The weather data would be integrated with the GPS system, so the system could automatically provide weather for the current location, programmed destination, or anywhere along the route. Data for any other city could also be accessed.
